

Function and Performance Testing

Project Name

UNESCO Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites Using Tableau

Date	7 th July 2026
Project Name	Heritage Treasures

Team Member Name: Pamarthi SriLakshmi
College Name: Seshadri Rao Gudlavalleru Engineering College

Introduction

Function and Performance Testing is an important phase of software development that ensures the application works correctly and efficiently. In this project, testing was performed to verify that all Tableau dashboards, filters, visualizations, and storyboards function as expected. The testing process also evaluated the performance of the dashboards while loading, filtering, and displaying UNESCO World Heritage data.

The objective of testing is to identify errors, verify functionality, and ensure that users receive accurate information through interactive dashboards.

Functional Testing

Functional testing verifies that each feature of the Tableau project performs according to the project requirements.

Functional Test Cases

Test Case ID	Test Scenario	Expected Result	Status
FT-01	Open Dashboard 1	Dashboard loads successfully	Pass
FT-02	Open Dashboard 2	Dashboard loads successfully	Pass
FT-03	Open Tableau Story	Story loads correctly	Pass
FT-04	Apply Country Filter	Correct country data displayed	Pass
FT-05	Apply Category Filter	Correct category information displayed	Pass
FT-06	View Maps	Maps display correctly	Pass

Test Case ID	Test Scenario	Expected Result	Status
FT-07	View Charts	Charts display accurate data	Pass
FT-08	Navigate Story Pages	Story pages open correctly	Pass

Performance Testing

Performance testing evaluates the responsiveness, speed, and efficiency of the Tableau dashboards under normal operating conditions.

Performance Test Cases

Test Case ID	Performance Parameter	Expected Result	Status
PT-01	Dashboard Loading Time	Less than 5 seconds	Pass
PT-02	Filter Response Time	Immediate response	Pass
PT-03	Chart Rendering	Smooth visualization	Pass
PT-04	Story Navigation	Fast page transition	Pass
PT-05	Data Accuracy	Correct visualization	Pass

Testing Methodology

The testing process involved verifying each dashboard individually. Every filter, chart, and visualization was checked using different combinations of data. Dashboard performance was measured by observing loading time and response speed. Story navigation was also tested to ensure users could move between pages without errors.

All visualizations were compared with the original UNESCO dataset to verify data accuracy and consistency.

Results

The testing process confirmed that all project functionalities operate successfully. Dashboard filters correctly display selected data, charts accurately represent heritage information, and story navigation works smoothly. The dashboards load within an acceptable time and provide a responsive user experience.

No major functional or performance issues were identified during testing.

Conclusion

The Function and Performance Testing phase successfully verified that the UNESCO Heritage Treasures project meets all functional and performance requirements. All dashboards, filters, charts, and storyboards work correctly and provide accurate visualizations. The project demonstrates reliable performance, user-friendly interaction, and effective data presentation, making it suitable for analysis and exploration of UNESCO World Heritage Sites.
